

SECURITY & PRIVACY BRIEF

Roleplay IT & Compliance Review

Voice roleplays only • Version 1.0 • 3 September 2026

Scope of this review

This document covers only Zell's browser-based voice roleplay: scenario setup, the simulated conversation, recording and transcription, post-roleplay scoring, feedback, and authorised review. It does not describe or approve any other Zell feature or customer-enabled integration.

Decision summary

PRIMARY APPLICATION AWS Milan (eu-south-1)	RECORDING STORAGE Google Cloud Storage — EU
VOICE PROCESSING ElevenLabs EU-isolated	FEEDBACK AI AWS Bedrock — EU geography
AUDIO RECORDING Stored for review and feedback	CUSTOMER DATA TRAINING Not permitted without written approval
ROLEPLAY CONTENT Synthetic scenario; no prospect call required	CONTRACTUAL FRAMEWORK DPA + subprocessor disclosures

What Zell provides in this scope

Zell provides an AI-supported training environment in which an authorised participant speaks with a simulated persona. Zell records and transcribes the roleplay, evaluates the transcript against the configured scorecard, and returns coaching feedback to authorised users.

GDPR position

Zell operates as the customer's processor for roleplay personal data. The controls, EU processing configuration, DPA commitments, and subprocessor safeguards described here support a GDPR-compliant deployment. The customer remains responsible for its lawful basis, participant notices, access decisions, and use of results.

01 / ARCHITECTURE

Roleplay data flow

- 1

Access. An authorised participant signs in and selects a customer-configured scenario, persona, and scorecard.
- 2

Live simulation. The browser establishes a secure session with the ElevenLabs EU-isolated environment. Participant audio is processed for speech recognition; synthetic voice is returned for the simulated persona.
- 3

Conversation output. At the end of the session, the roleplay transcript and session metadata are returned to Zell. Zell retrieves the roleplay recording for customer review.
- 4

Private storage. Application and relational data are stored in AWS Milan. Recordings and roleplay files are stored in private Google Cloud Storage buckets configured for the EU.
- 5

Scoring and feedback. The transcript, scorecard, and relevant scenario context are processed by EU-hosted AI services to generate scores, explanations, and coaching feedback.
- 6

Authorised review. The participant and permitted customer reviewers access the recording, transcript, scores, and feedback through tenant-scoped application controls.

Personal data and content in scope

CATEGORY	EXAMPLES	PURPOSE
Account data	Name, work email, role, tenant/workspace	Authentication, access and administration
Roleplay inputs	Scenario, persona instructions, scorecard, optional training context	Configure the simulated conversation and evaluation
Voice data	Live audio and the resulting recording	Run, replay and review the roleplay
Transcript	Speaker-labelled roleplay dialogue	Scoring, feedback and authorised review
Evaluation data	Scores, explanations, snippets and coaching feedback	Training and performance development
Technical data	Session, security, diagnostic and audit metadata	Operate, protect and troubleshoot the service

Data minimisation

The roleplay can use a fictional persona and synthetic business scenario. Zell does not require recordings or personal data from real prospects or customers for this use case.

02 / HOSTING & SUBPROCESSORS

Roleplay processing locations

The following providers are relevant to the roleplay service itself or its supporting security and operational functions.

PROVIDER / SERVICE	ROLE IN THIS USE CASE	DATA INVOLVED	PROCESSING LOCATION
Amazon Web Services	Frontend, backend, PostgreSQL database and application infrastructure	Account, configuration, transcript, scores, feedback, metadata	Milan, Italy (eu-south-1)
AWS Bedrock	Post-roleplay AI scoring and feedback	Transcript, scorecard and relevant scenario context	EU geographic inference profile
Google Cloud Storage	Private object storage for recordings and roleplay files	Audio recordings and customer-provided files	European Union multi-region
ElevenLabs	Real-time speech recognition, synthetic voice and conversational orchestration	Live audio, transcript and roleplay context	EU-isolated environment
Microsoft Azure	EU-hosted semantic embeddings used in feedback analysis	Short feedback phrases / derived text	European Union deployment
Cloudflare	DNS, web delivery and security controls	IP address, request and security metadata	Global edge network; nearest data centre
Langfuse	AI quality, prompt and trace monitoring	Prompt/response content and technical trace metadata	European Union
PostHog	Product usage analytics	Usage and device metadata; audio is not intentionally sent	Frankfurt, Germany / EU
Sentry	Error and performance diagnostics	Diagnostic and technical metadata; audio is not intentionally sent	Germany / EU region
Resend	Transactional service email	Recipient address and message metadata	Ireland (eu-west-1)

EU processing configuration

Core application data, recordings, voice processing, and AI feedback processing are configured for European locations. Cloudflare's edge security service is globally distributed; its role is limited to web traffic delivery and protection rather than storage of roleplay recordings.

03 / SECURITY & LIFECYCLE

How roleplay data is protected

CONTROL AREA	CURRENT MEASURE
Access control	Authenticated access, role-based permissions, and tenant/workspace scoping restrict customer data to authorised users.
Transport security	Roleplay and application traffic is encrypted in transit using TLS-protected provider endpoints.
Recording storage	Recordings are held in a private EU storage bucket. Playback access is provided through time-limited signed URLs.
Secrets and credentials	Service credentials are kept outside customer-facing application content and access is limited by operational need.
Monitoring	Security, application, error, and AI trace monitoring support detection and investigation of abnormal behaviour or failures.
Isolation	Application queries and access checks are scoped to the customer tenant; users cannot intentionally browse another tenant's roleplays.
Personnel	Personnel and authorised contractors with access are bound by confidentiality obligations and least-privilege expectations.
Incident response	Zell maintains incident handling procedures and will notify the customer without undue delay after becoming aware of a personal-data breach affecting the service.

Retention, deletion and return

Is the audio recording retained? Yes. Recording is part of the requested roleplay use case and is stored so authorised users can replay and review the exercise.

How long is data retained? Roleplay data is retained for the customer's contract term or a shorter period agreed with the customer. The customer should define its required operational retention period during implementation.

What happens when a roleplay is deleted? Deletion removes the application record and related relational data and queues deletion of the corresponding private recording. Provider backups age out through ordinary backup-retention cycles.

What happens at termination? At the customer's choice and subject to the DPA, Zell returns or deletes personal data after the services end, except where applicable law requires limited retention.

04 / PRIVACY & AI GOVERNANCE

Roleplay compliance FAQ

Who is controller and who is processor?

The customer is the controller for participant data and decides why the roleplay is used, who participates, and who may review results. Zell acts as processor and processes the data only to provide the contracted roleplay service and on documented instructions.

Is customer data used to train general-purpose AI models?

No. Zell's DPA prohibits use of customer personal data to train or improve general-purpose AI models unless the customer gives express written authorisation. Providers are configured and contracted for service processing, not customer-data model training.

Does the roleplay make employment decisions?

No autonomous employment decision is required or intended. Scores and feedback are training aids. Customers should retain meaningful human review and should not use a roleplay score as the sole basis for a decision with legal or similarly significant effects.

How are data-subject requests handled?

The customer remains the primary contact for participants. Zell assists with access, correction, deletion, restriction, portability, objection, and other requests where the relevant data is held in the service.

Does Zell support DPIAs and audits?

Yes. Zell provides information reasonably required for the customer's data-protection impact assessment and makes compliance information available under the DPA. Audits are handled subject to confidentiality, security, scope, and reasonable-frequency safeguards.

How are subprocessors governed?

Zell contractually requires subprocessors to protect personal data to standards consistent with Zell's processor obligations. Zell remains responsible for their performance within the limits of the DPA and provides notice of material changes through its subprocessor disclosure process.

Customer-side requirements

Before launch, the customer should document its lawful basis, give participants an appropriate privacy notice, define retention and reviewer access, avoid unnecessary special-category data, and retain human oversight over the use of scores.
